

Homework 1 (due 9/5)

1. Let I_1 and I_2 be two intervals in \mathbb{R}^2 . Show the following elementary fact that $I_1 \cup I_2$ is a union of finitely many non-overlapping intervals J_k for $k = 1, \dots, N$, with

$$\sum_{k=1}^N v(J_k) \leq v(I_1) + v(I_2).$$

Hint. All intervals mean closed intervals. You may prove by cases with the help of sketching figures. Note that this fact is used in the proof of Theorem 3.2.

2. (i) Show that if $f : [a, b] \rightarrow \mathbb{R}$ is continuous where $-\infty < a < b < \infty$, then its graph $E = \{(x, f(x)) : x \in [a, b]\}$ as a subset of \mathbb{R}^2 has the Lebesgue measure zero.
- (ii) Show that that if $f : \mathbb{R} \rightarrow \mathbb{R}$ is uniformly continuous where $-\infty < a < b < \infty$, then its graph $E = \{(x, f(x)) : x \in \mathbb{R}\}$ as a subset of \mathbb{R}^2 has the Lebesgue measure zero.
3. Let $A = \{r_1, r_2, \dots\}$ be the set of rational numbers in $(0, 1)$. Given $\varepsilon \in (0, 1)$, let

$$A_k = (r_k - \frac{\varepsilon}{2^k}, r_k + \frac{\varepsilon}{2^k}) \cap (0, 1), \quad k = 1, 2, \dots,$$

and

$$E = \bigcup_{k=1}^{\infty} A_k.$$

Compute $|E|$ and ∂E .

(Note: This gives an example that Lebesgue measure of the boundary set of an open set may not be zero.)

4. (i) Show that if $E \subset \mathbb{R}$ is such that $|E| = 0$, then $\overset{\circ}{E} = \emptyset$.
- (ii) Show that if $E \subset [0, 1]$ is Lebesgue measurable with $|E| = 1$, then E is dense in $[0, 1]$.
